

Product Vision:

I want Whispurr to become an app that doesn't feel like an app. It should feel so seamless that it becomes part of the system and, over time, part of the user's natural workflow like a habit. The ideal experience is simple: open your system, say what you are thinking, and let Whispurr take care of the grunt work. By removing the effort of constantly typing, rephrasing and formatting, Whispurr should make it easier for people to freely express their thoughts while reducing the mental burden that comes with switching between apps and tools.

The current Kivi already has the foundation for this vision. It can stay active in the background, understand the application the user is in, and adapt its output accordingly. So instead of caressing a new feature heavy AI assistant I want to build on the existing model.

There are two goals: get people to try Whispurr and give them a reason to stay.

The tutorial should immediately attract the user, be vibrant and engaging, but most importantly, be extremely clear. There should not be any ambiguity and we shouldn't bore them or irritate them with too many steps. It should teach the product through use rather than show off everything it can do. Ideally, the product should be intuitive enough that users can start using it without even needing the tutorial.

Once users understand the product, staying should come from how the app naturally fits into their workflow. Instead of requiring users to repeatedly open the app, Whispurr should be customised once and then stay out of the way. I want all the features to revolve around this core idea. The existing Dictionary and Shorthands serves this very purpose it makes it easier on the user to speak in their own way with their own jargons and makes repetitive tasks like sign off easier and faster.

I also want to rethink Styles as Modes because the name styles point more towards the visual styles like themes. Alongside Professional and Casual modes, I want to introduce Prompting Mode for AI tools as it has become an essential part of almost all workflows. I would like to think of this as a bridge

between raw human language to AI language just like how programming languages are a bridge between humans and machines.

The system can automatically adapt to the app that they are using, but if the user wants something different just once, they shouldn't have to go to the app and change. For this there can be a keyboard shortcut that lets them customise in real time. Alt/Option + scroll allows them to quickly switch modes. Alt/Option + left click and scroll allows them to choose the output language even when they speak in another language.

Another feature like Moods can be added which basically adds emojis based in the undertone of our statements in casual mode.

Not every situation allows people to speak aloud. So there can be Whisper Mode that lets users use their phone or microphone to speak when they need to keep their voice down. When there is a quick thought we usually stop our work note it down or try to remember it and forget and stress over it. So there can be a Quick Notes that lets them capture a thought from the icon present on screen and the ideas are stored in the scratch pad. All these features support the same goal: keeping the user in their workflow.

The home screen experience should also add value and reflect the product's ideology. Instead of showing the number of words dictated, I want to focus on time saved, using relatable comparisons to make that value meaningful. The cat can grow or become more active (the Kivi bird can hatch and grow) with the time saved, making the impact feel more personal.

When it comes to the design part of it including the name, mascot and colour themes, I again wanted it to reflect the base vision. The cat represents Whispurr itself - fast, flexible and quietly there. Its different eye colours represent the contrast between professional and casual communication, while the coffee-brown visual language represents productivity and focus and its not too bright its subtle and instills a sense of calmness.

I don't want Whispurr to be a know-it-all, do-it-all AI assistant. There is a very niche problem and I want it solve exactly that. I don't want this app to be a typical AI which does all the work for us I just want it to help people express their own thoughts easily.

The ultimate goal is for Whispurr to become a habit — something users don't consciously think about using. It should simply feel like it was part of the system all along.
